1 Framework Overview

Time Series Libraries

- Pandas: <https://pandas.pydata.org/> - Data manipulation and time series tools
- StatsModels: <https://www.statsmodels.org/> - Statistical models and tests
- Prophet: <https://facebook.github.io/prophet/> - Forecasting at scale by Meta
- Darts: <https://unit8co.github.io/darts/> - Time series made easy
- Sktime: <https://www.sktime.org/> - Unified interface for ML with time series
- TensorFlow Time: <https://www.tensorflow.org/> - Deep learning for time series
- pmdarima: <https://alkaline-ml.com/pmdarima/> - ARIMA models made easy
- KATS: <https://github.com/facebookresearch/kats> - Time series analysis by Meta

2 Data Manipulation with Pandas

2.1 Time Series Objects

Creating Time Series

```
1 # Create time series from dates
2 dates = pd.date_range('2023-01-01',
3                       periods=10,
4                       freq='D')
5 ts = pd.Series(data, index=dates)
6
7 # Convert column to datetime
8 df['date'] = pd.to_datetime(df['date'])
```

2.2 Resampling and Rolling Windows

```
1 # Resample to monthly frequency
2 monthly = ts.resample('M').mean()
```

```

3
4 # Calculate rolling mean
5 rolling_mean = ts.rolling(window=7).mean()

```

3 Framework Examples

3.1 Pandas Time Series

Advanced Pandas Operations

```

1 import pandas as pd
2
3 # Create datetime index
4 dates = pd.date_range(start='2023-01-01',
5                       end='2023-12-31',
6                       freq='D')
7
8 # Time series operations
9 ts = pd.Series(np.random.randn(len(dates))
10               ,
11               index=dates)
12
13 # Datetime accessors
14 ts.dt.year
15 ts.dt.month
16 ts.dt.day_name()
17
18 # Shifting and lagging
19 ts.shift(periods=1) # Lag
20 ts.shift(periods=-1) # Lead
21
22 # Rolling statistics
23 ts.rolling(window=7).mean()
24 ts.rolling(window=7).std()
25 ts.rolling(window=7).quantile(0.95)
26
27 # Resampling
28 ts.resample('M').mean() # Monthly
29 ts.resample('Q').sum() # Quarterly
30 ts.resample('Y').last() # Yearly

```

3.2 StatsModels Examples

Statistical Time Series Analysis

```

1 import statsmodels.api as sm
2 from statsmodels.tsa.seasonal import STL
3
4 # Decomposition using STL
5 stl = STL(ts, period=12)
6 result = stl.fit()
7 seasonal = result.seasonal
8 trend = result.trend
9 resid = result.resid
10
11 # SARIMAX Model
12 model = sm.tsa.statespace.SARIMAX(
13     ts,
14     order=(1, 1, 1),
15     seasonal_order=(1, 1, 1, 12),
16     enforce_stationarity=False
17 )
18 results = model.fit()
19
20 # Diagnostics
21 results.plot_diagnostics()
22 print(results.summary())
23
24 # Forecast
25 forecast = results.get_forecast(steps=30)
26 conf_int = forecast.conf_int()

```

3.3 Prophet Advanced Usage

Meta Prophet Examples

```
1 from prophet import Prophet
2
3 # Advanced Prophet model
4 model = Prophet(
5     changepoint_prior_scale=0.05,
6     seasonality_prior_scale=10,
7     holidays_prior_scale=10,
8     seasonality_mode='multiplicative',
9     changepoint_range=0.9,
10    yearly_seasonality=True,
11    weekly_seasonality=True,
12    daily_seasonality=False
13 )
14
15 # Add custom seasonality
16 model.add_seasonality(
17     name='monthly',
18     period=30.5,
19     fourier_order=5
20 )
21
22 # Add country holidays
23 model.add_country_holidays(country_name='
    US')
24
25 # Fit and predict
26 model.fit(df)
27 future = model.make_future_dataframe(
28     periods=365,
29     freq='D',
30     include_history=True
31 )
32 forecast = model.predict(future)
33
34 # Components plot
35 model.plot_components(forecast)
```

3.4 Darts Framework

Darts Time Series Tools

```
1 from darts import TimeSeries
2 from darts.models import (
3     Prophet,
4     ARIMA,
5     ExponentialSmoothing,
6     TCNModel,
7     TransformerModel
8 )
9
10 # Create Darts TimeSeries
11 series = TimeSeries.from_dataframe(
12     df,
13     'date',
14     'value',
15     freq='D'
16 )
17
18 # Split data
19 train, val = series.split_before(0.8)
20
21 # Multiple models comparison
22 models = [
23     Prophet(),
24     ARIMA(p=2, d=1, q=1),
25     ExponentialSmoothing(),
26     TCNModel(
27         input_chunk_length=24,
28         output_chunk_length=12
29     ),
30     TransformerModel(
31         input_chunk_length=24,
32         output_chunk_length=12
33     )
34 ]
35
36 # Fit and evaluate
37 for model in models:
38     model.fit(train)
39     forecast = model.predict(len(val))
40     print(f"MAPE: {mape(val, forecast)}")
```

3.5 Sktime Examples

Sktime Unified Interface

```
1 from sktime.forecasting.base import
   ForecastingHorizon
2 from sktime.forecasting.compose import
   TransformedTargetForecaster
3 from sktime.forecasting.theta import
   ThetaForecaster
4 from sktime.transformations.series.
   detrend import Deseasonalizer
5
6 # Create pipeline
7 forecaster = TransformedTargetForecaster
   ([
8     ('deseasonalize', Deseasonalizer()),
9     ('forecast', ThetaForecaster())
10 ])
11
12 # Fit and predict
13 forecaster.fit(y_train)
14 fh = ForecastingHorizon(y_test.index,
   is_relative=False)
15 y_pred = forecaster.predict(fh)
16
17 # Cross-validation
18 from sktime.forecasting.model_selection
   import (
19     temporal_train_test_split,
20     SingleWindowSplitter
21 )
22
23 cv = SingleWindowSplitter(
24     train_length=100,
25     test_length=24,
26     step_length=12
27 )
```

3.6 pmdarima (Auto ARIMA)

Automated ARIMA Modeling

```
1 import pmdarima as pm
2
3 # Auto ARIMA
4 model = pm.auto_arima(
5     y,
6     start_p=1,
7     start_q=1,
8     test='adf',
9     max_p=3,
10    max_q=3,
11    m=12,
12    start_P=0,
13    seasonal=True,
14    d=1,
15    D=1,
16    trace=True,
17    error_action='ignore',
18    suppress_warnings=True,
19    stepwise=True
20 )
21
22 # Get model summary
23 print(model.summary())
24
25 # Make predictions
26 n_periods = 24
27 forecast, conf_int = model.predict(
28     n_periods=n_periods,
29     return_conf_int=True
30 )
31
32 # Update model with new data
33 model.update(new_data)
```

3.7 KATS (by Meta)

Meta KATS Framework

```
1 from kats.consts import TimeSeriesData
2 from kats.models.prophet import
   ProphetModel
3 from kats.models.sarima import
   SARIMAModel
4 from kats.detectors.outlier import
   OutlierDetector
5 from kats.tsfeatures.tsfeatures import
   TsFeatures
6
7 # Create TimeSeriesData object
8 ts = TimeSeriesData(
9     df[['time', 'value']]
10 )
11
12 # Detect outliers
13 outlier_detector = OutlierDetector(ts)
14 outliers = outlier_detector.detect()
15
16 # Calculate time series features
17 features = TsFeatures().transform(ts)
18
19 # Prophet model with KATS
20 params = ProphetModel.
   get_parameter_search_space()
21 model = ProphetModel(ts, params)
22 model.fit()
23 forecast = model.predict(steps=30)
24
25 # SARIMA model with KATS
26 sarima = SARIMAModel(
27     ts,
28     p=2,
29     d=1,
30     q=1,
31     seasonal_p=1,
32     seasonal_d=1,
33     seasonal_q=1,
34     seasonal_period=12
35 )
36 sarima.fit()
37 sarima_forecast = sarima.predict(steps
   =30)
```

4 Statistical Analysis

4.1 Decomposition

Time Series Components

```
1 from statsmodels.tsa.seasonal import
   seasonal_decompose
2
3 result = seasonal_decompose(ts,
4     model='multiplicative',
5     period=12)
6 trend = result.trend
7 seasonal = result.seasonal
8 residual = result.resid
```

4.2 Stationarity Tests

```
1 from statsmodels.tsa.stattools import adfuller
2
3 def check_stationarity(ts):
4     result = adfuller(ts)
5     print(f'ADF Statistic: {result[0]}')
6     print(f'p-value: {result[1]}')
```

5 Forecasting Models

5.1 Prophet

Facebook Prophet

```
1 from prophet import Prophet
2
3 # Initialize and fit
4 model = Prophet(
5     changepoint_prior_scale=0.05,
6     seasonality_prior_scale=10,
7     seasonality_mode='multiplicative'
8 )
9 model.fit(df)
10
11 # Make predictions
12 future = model.make_future_dataframe(
13     periods=30
14 )
15 forecast = model.predict(future)
```

5.2 SARIMA Models

```
1 from statsmodels.tsa.statespace.sarimax import
   SARIMAX
2
3 model = SARIMAX(ts,
4     order=(1, 1, 1),
5     seasonal_order=(1, 1, 1, 12)
6 )
7 results = model.fit()
```

6 Deep Learning Approaches

6.1 TensorFlow Time Series

LSTM for Time Series

```
1 from tensorflow.keras.models import
  Sequential
2 from tensorflow.keras.layers import LSTM
3
4 model = Sequential([
5     LSTM(50, activation='relu',
6         input_shape=(n_steps, n_features
7         )),
8     Dense(1)
9 ])
10 model.compile(optimizer='adam',
11               loss='mse')
```

6.2 PyTorch Forecasting

```
1 from pytorch_forecasting import
  TimeSeriesDataSet
2 from pytorch_forecasting import
  TemporalFusionTransformer
3
4 # Create dataset
5 training = TimeSeriesDataSet(
6     data=training_data,
7     time_idx="time_idx",
8     target="target",
9     group_ids=["group"],
10    max_encoder_length=24,
11    max_prediction_length=12
12 )
```

7 Visualization Techniques

7.1 Matplotlib/Seaborn

Time Series Plots

```
1 import seaborn as sns
2 import matplotlib.pyplot as plt
3
4 # Time series line plot
5 plt.figure(figsize=(12, 6))
6 sns.lineplot(data=df, x='date', y='value'
7             )
8
9 # Multiple time series
10 sns.lineplot(data=df, x='date', y='value'
11             ,
12             hue='category')
```

8 Best Practices

⚠ Common Pitfalls to Avoid:

- Not checking for stationarity
- Ignoring seasonality
- Data leakage in train/test split
- Not handling missing values properly

8.1 Performance Metrics

```
1 from sklearn.metrics import
  mean_absolute_error
2 from sklearn.metrics import mean_squared_error
3
4 mae = mean_absolute_error(y_true, y_pred)
5 rmse = np.sqrt(mean_squared_error(
6     y_true, y_pred))
7 mape = np.mean(np.abs((y_true - y_pred)
8                 / y_true)) * 100
```

9 Advanced Topics

9.1 Feature Engineering

Time-Based Features

```
1 # Extract datetime components
2 df['year'] = df['date'].dt.year
3 df['month'] = df['date'].dt.month
4 df['day'] = df['date'].dt.day
5 df['dayofweek'] = df['date'].dt.dayofweek
6
7 # Lag features
8 df['lag_1'] = df['value'].shift(1)
9 df['lag_7'] = df['value'].shift(7)
10
11 # Rolling features
12 df['rolling_mean'] = df['value'].rolling(
13     window=7).mean()
14 df['rolling_std'] = df['value'].rolling(
15     window=7).std()
```
